Subj: NAVY'S INSTALLATION RESTORATION (IR) PROGRAM

Enclosed is the Revised Draft Final Report Phase II Remedial Investigation (RI) for the Red Hill Oily Waste Disposal Facility at Fleet & Industrial Supply Center (FISC), Pearl Harbor. Portions of the draft final documents have been revised and should be removed from your files to avoid confusion. Please replace them with the enclosed revised draft final documents.

The submission of these documents is in accordance with the Superfund Amendments and Reauthorization Act (SARA) of 1986 which requires federal agencies to coordinate closely with the regulatory agencies and the Natural Resource Trustees during Installation Restoration (IR) investigations.

This phase of the RI characterized three exposure areas of concern (EAOCs) and investigated potential connections between the perched groundwater and the basal aquifer. The human health preliminary risk evaluation (PRE) performed for the soil at the EAOCs concluded that no significant risk is posed by contaminants found in the soil. No further action is recommended at these EAOCs. The characterization of the basal aquifer beneath the site concluded that although the fate and transport pathway for contaminants is potentially complete, any transport that does occur will be insignificant. Consequently, no further action is recommended concerning the basal aquifer.

Should you have any questions concerning the document, please contact Mr. Wesley Ching of our Environmental Restoration Division at (808) 474-4513.

Sincerely,

Melvin Z. Waki

MELVIN Z. WAKI, P.E.
Head
Environmental Engineering Department
